Technology Leaders in Hot Water Storage And Integration

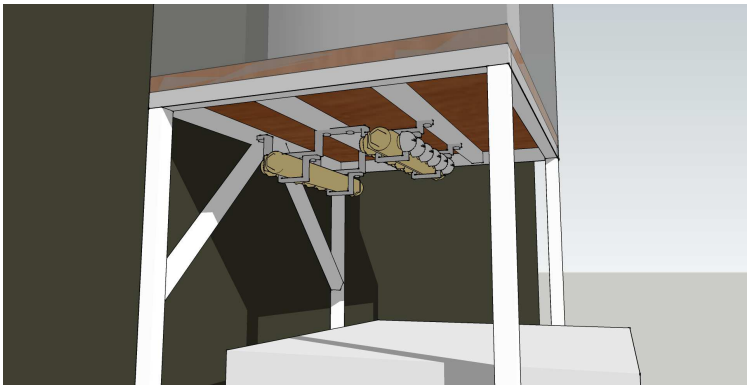

Framed District Unvented System

Designed primarily for properties connected to communal boiler plants, the system comprises of an unvented cylinder, 125 litres, fitted on top of a steel support frame sized to accept a washing machine.

The system will typically be fitted with a plate heat exchanger for isolation from the communal pipework, and will use either a coil to heat the stored water, or a plate heat exchanger for better performance (including lower return temperatures).

There is ample space both around the cylinder, and underneath for additional controls, such as pumps and even underfloor heating manifolds.
